SMARTPRS 3 · BUILD PROGRAMME

Change & Progress Summary

Everything built, fixed or updated across the SmartPRS 3 rebuild

PERIOD COVERED	PREPARED	ORGANISED BY
8 – 11 September 2026	**11 September 2026**	**Module & sub-menu**

This summary lists everything built, changed or fixed in SmartPRS 3 between 8 and 11 September 2026, organised the same way the product's own menu is — module by module, sub-menu by sub-menu — in plain, non-technical language. Items behind the scenes (performance, security, setup tooling) that don't sit under a single on-screen menu are grouped in their own section at the end.

05 Leave
06 Payroll
07 Assets
08 Reports & Analytics
09 Administration
10 Organization Setup / Configuration
11 HR Letters
12 Platform, Performance & Security

01 Main

11 items

- Added a "Today" view so employees only ever see their own attendance for the day, closing a gap where two employees sharing a name could have seen each other's punches.
- Notifications for leave decisions are now actually queued and shown in the app; previously an employee found out their leave was rejected only by happening to check the screen, since nothing told them.
- Ran the new approvals workflow engine through a strict validation check before switching it on, and found and fixed 4 real design flaws that would have left an employee's leave or money request stuck with no way for anyone to see why.
- Rebuilt the sidebar menu to mirror the real product's structure so every screen, including configuration screens, has a proper home and locked features show consistently as locked rather than disappearing.
- Rebuilt the Main tab — Live Salary, Escalation Desk, Approvals Inbox, Notifications, AI Assistant and How It Works — so each is backed by real, live data instead of placeholders.
- Escalation Desk now matches the old product's escalation register exactly, Live Salary gained an all-employees/one-employee view, and How It Works was redesigned as a card grid.
- Added a help guide ("i" icon) to every screen with how-to and troubleshooting tips, plus a collapsible sidebar that remembers your preference.
- Fixed sidebar section icons that weren't showing up, made the company logo clickable to return to the dashboard, and rebuilt the account menu popup with a working sign-out.
- Added a self-service Account Settings screen (photo upload, password change) for every user, and fixed avatar/logo styling issues the owner had flagged from screenshots.
- Rebuilt "My Space" into a personal dashboard (profile, attendance, recent payslips, leave balance) and, while wiring it up, found and fixed a real gap where ordinary employees could not view their own payslip at all.
- Per the owner's direct correction, simplified "My Space" back down to just a photo and password, undoing the fuller personal dashboard added moments earlier.

02 Hiring & Onboarding

4 items

- Built the Recruitment pipeline: raising and approving hiring requests, moving candidates through interview stages, and hiring directly into a new employee record.
- Built Self-Onboarding: a secure link lets a new joiner fill in their own details before HR reviews and approves them into the system, with no password needed for the joiner.
- Rebuilt Recruitment to match the old product's screen exactly, including a salary "what-if" simulator and bulk WhatsApp messaging (messages are only queued for now — no real WhatsApp sending is connected yet).
- Built Onboarding Status checklists (for new joiners and transfers) and Background Verification tracking, including automatic reminders when a re-check is due within 30 days.

03 People

15 items

- Added a proper record of when someone actually leaves the company (previously the system only knew someone had left, not when), so payroll can now correctly stop or prorate pay for the exit month instead of risking paying someone after they've gone.
- Built the Probation tracking board (confirm/extend with history) and added Email and Document/Photo upload as new employee-record field types.
- Built Import Employees: the same field list used for setup now generates the exact spreadsheet template used for bulk-importing staff, so the template can never go out of date.
- Added a downloadable, properly formatted PDF ID card (photo, company colours) built without relying on any paid design library.
- Built the Transfers workflow: raise, approve and apply a branch/department/company transfer, with an auto-generated transfer-order letter.
- Built Teams, Document Tracker (with expiry alerts) and Exit & Full-and-Final settlement screens to match the old product.
- The employee bulk-upload template is now a real Excel file with built-in dropdown menus for valid values, cutting down on upload errors.
- Added one consistent Company/Branch/Department/Team filter (with an "ALL" option) across every employee list and report, fixing cases where filtering used to miss people due to inconsistent data.
- The employee Directory is now the single place to both add and edit employee records, with protection against accidentally creating duplicate employee codes.
- Directory gained a simple Active/Deactivate toggle and a safer Delete with a 72-hour undo window before an employee's record is actually archived — nothing is destroyed immediately.
- Directory status icons now match the old product's look, and the Full & Final settlement screen shows the employee's full details for context.
- ID Cards gained a "Visitor" badge option, and fixed a bug where non-standard photo file types printed as a blank "photo on file" placeholder instead of the real photo.
- Found and fixed a real bug where the Delete button on Document Tracker silently did nothing at all, and fixed a matching bug where a deleted document still incorrectly showed as "on file" in the Directory.
- Added a downloadable/importable Roster template restricted to the company's own real shift codes, and made Designation dropdowns automatically narrow to match the selected Role wherever both appear.
- Added a quick "saved formats" dropdown to the ID Card designer so switching between different card layouts no longer requires scrolling to a table.

04 Time & Attendance

11 items

- Attendance can now import punch records directly from biometric devices instead of requiring everything to be typed by hand, safely rejecting any punch it can't match to exactly one employee (and, separately, salary advances and loans now actually show up as real monthly deductions on payslips instead of being tracked only on paper).
- Wired attendance status (present/absent/half-day) to a configurable rules engine instead of one hardcoded line of code, and added a rule so someone who punched in but never punched out is marked half-day rather than a full day's absence.
- Half-day attendance results now correctly flow through to pay calculations instead of silently being rounded up to a full day or dropped, and fixed a related setup bug that could have blocked future updates on existing customer databases.
- Fixed a bug where paid holidays and weekly-offs were priced correctly in settings but the system had no way to actually recognize such a day, so they were being marked as unpaid absences; also closed a near-miss that could have made every Sunday show as absent.
- Built Bulk Attendance upload: a spreadsheet of attendance data is checked row by row and only becomes real attendance once an approver reviews and approves the whole batch, with safeguards against duplicate imports.
- Built the Attendance Report (muster), driven from the exact same calculation payroll uses, so the report and the payslip can never disagree with each other.
- Added automatic daily absence detection with notifications, plus filters and a configurable column layout for the attendance report; also found and fixed a privacy leak where an employee's notification inbox was showing messages meant for a colleague.
- Brought Working Shifts, Late & Comp-Off Policy and Biometric Device screens up to the old product's field labels, and added a Geo-Fence Map (drawn in-house, no paid mapping service needed).
- Renamed Holiday Calendar to Holiday/W.OFF Schedule and added support for flexible weekly-off patterns (e.g. every 1st and 3rd Saturday), not just a fixed day.
- Fixed a real bug where the Manual Attendance Entry screen could completely deny access to someone who should only be allowed to punch their own attendance, and merged single-punch and bulk-upload entry into one combined screen matching the old product.
- Added fully configurable colour-coded severity badges for late arrivals and over-budget break time on the Daily Attendance screen, with every threshold and colour set by the company rather than fixed in code.

05 Leave

4 items

- Added a real balance check to leave requests — previously an employee with 3 days of leave could request 40 and nothing would stop it until an approver happened to notice.
- Comp-off leave is now automatically and safely credited for working a weekly-off or holiday (only once, even if the page is refreshed); overtime hours are now recorded too, though not yet paid, since no overtime rate has been configured.
- Fixed a common leave complaint: a public holiday that fell inside a leave request was being deducted from the employee's leave balance instead of being excused.
- Built configurable Leave Types, an editable Holiday Calendar, and automatic annual leave grants (and year-end expiry) per company policy.

06 Payroll

22 items

- Found and fixed a critical bug where every payslip was calculated using the employee's full YEARLY salary as if it were the MONTHLY figure, making every payslip 12 times too high; added a safeguard so this can't silently happen again.
- Statutory payroll deductions (PF, ESI, PT, TDS) are now actually calculated during a payroll run instead of being silently skipped, with strict safeguards ensuring no placeholder tax rate can ever reduce a real employee's pay.
- Added the ability to print a clean, properly formatted payslip as a PDF via the browser, instead of accidentally printing the whole application screen (search box, sidebar and all).
- Salary components like HRA can now be defined as flexible formulas (e.g. "40% of basic, capped at ₹20,000") through settings, instead of needing a software release for every custom salary rule.
- The automatic checks that prove payroll math and tax logic are correct were not actually running before each release; they're now a required part of every release check. Also fixed the payroll screen so it can show more than one statutory deduction type at once.
- Late-arrival penalty deductions now actually reduce pay (previously calculated but never applied); a serious rounding bug that would have deducted a full day's pay instead of half a day was caught and fixed in testing before it ever reached a real payslip.
- Added a proper print layout for payslips and letters, including printing an entire month's payslips for every employee in one go, and fixed an embarrassing bug where internal security warnings were appearing on the printed payslip.
- Rebuilt the Salary Structure configuration screen to use each company's own real branch/component data and save to the server, instead of being hardcoded to one demo customer and saved only in a browser (which meant it could vanish or apply to the wrong company).
- Simplified the Salary Structure screen per the owner's request, and fixed a real bug (a leftover test value in the code) that was blocking every attempt to publish new salary rules with a confusing error.
- Added a configurable Payslip Format designer so a company can control exactly which pay lines show, their order and their names, per branch or department — without it ever being able to change the actual pay amount.
- Rebuilt the Payslip Format designer to exactly match the requested design, tied to each company's own real branch and department data instead of one demo customer's names, and saved centrally instead of only in one person's browser.
- Built out the Payroll sub-menus (Pay Cycle & Lots, Salary Schedules, Salary Approval, Payslips, Salary Ledger) and added a Financial Year setting.
- Built a configurable Salary Approval workflow (e.g. HR sign-off, then Finance sign-off) that a payroll run must pass through before it can be authorised for payment.
- Pay Cycle settings can now be scoped to specific companies/branches/teams, and payroll runs now correctly use each employee's own attendance window and shift times instead of one company-wide setting.
- Rebuilt Salary Advance with a proper 3-level approval flow and automatic EMI calculation, and made sure the internal admin-only platform console is completely hidden from customer accounts.
- Fixed Pay Cycle so it correctly supports paying in a later month than the attendance window it covers (e.g. a 22 Aug–21 Sep attendance window paying out on 1 Oct) — a real payroll scheduling gap.
- Investigated (without changing anything live) why salary rules published on the Salary Structure screen weren't actually affecting payroll; confirmed no wrong numbers have gone out, and is checking with the owner on how to safely turn this on rather than risk a wrong deduction on a real payslip.
- Built (but did not yet switch on) the translation logic needed to connect published Salary Structure rules to actual payroll calculations, so this can go live safely in a later step; also added more company logo/branding options.
- Reworked the Salary Structure screen's layout to fix constant flickering and excessive side-scrolling while configuring salary rules.
- Reverted a Salary Structure layout change per the owner's direct correction — every field of every salary rule now stays visible at all times rather than being hidden behind an Edit button.
- Reformatted the Salary Structure screen again per owner feedback so each salary rule fits on one compact line instead of wrapping across two.
- Found that two Salary Structure screen fixes the owner had specifically asked for had been silently undone by a later, unrelated change, and restored both — a reminder to always re-check what's actually live before building on it.

07 Assets

2 items

- Built the Assets register (issue and return tracking) along with Roster (per-employee shift scheduling), a live Salary Calculation Guide, and support for ZKTeco biometric devices.
- Rebuilt Assets into two clear sections — stock on hand and issue/return tracking — and fixed a real bug where the recovery amount charged for a lost or damaged asset was typed in but never actually saved.

08 Reports & Analytics

3 items

- Built a Headcount report showing employee counts by company, branch, department, designation and team, drillable down to each level.
- Rebuilt the Attendance Summary report with flexible date-range picking, full filtering, charts and one-click Excel export.
- Added a Reports hub, a raw Datasets export tool, Attrition tracking, PF/ESI/TDS summary reports and Activity Logs — all with consistent filters, date ranges, charts and Excel/CSV export.

09 Administration

10 items

- Built the first working Accounts screen so managers and other roles can actually be assigned to real logins, with strong safeguards: nobody can promote or demote themselves, the last remaining administrator can't be removed, and two logins can't be linked to the same employee.
- Added a "Revoke" button so a leaked or no-longer-needed API access key can actually be disabled, and fixed the public web address so visitors land on the real product instead of an internal developer console.
- Found and fixed a real security gap: if two managers were accidentally set up reporting to each other, each could see the other's salary, leave and attendance details without it ever showing up as a problem; added an automatic check that scans for this kind of organisation-chart error.
- Added a system Health/diagnostics screen that reports on real failure conditions the team has actually hit before, rather than a generic dashboard that could say "all fine" while something is actually broken.
- Built User Management (invite a login, reset password, disable/enable access) and confirmed Loans now run through the exact same reviewed flow as Salary Advance.
- Split 5 People-menu screens (Directory, Probation, Teams, Transfers, ID Cards) so each now has its own independent on/off permission switch, instead of all 5 sharing one switch that made it impossible to grant access to just one of them.
- Fixed a live crash on the Roles & Permissions screen caused by an earlier same-day change that had removed something still needed elsewhere.
- Rebuilt User Management so it actually lists every employee (not just people who already have a login), with simple Reset Password and Deactivate buttons only, exactly as the owner requested.
- Fixed User Management so the Email column shows an employee's real email on file instead of "not linked," and added the option to set a new password manually instead of only emailing a reset link.
- Fixed the Roles & Permissions "Role" dropdown, and every new login created via Reset Password, to use the company's own real configured job roles instead of guessing someone's access level from their job title.

10 Organization Setup / Configuration

18 items

- Built the Employee Field register: a company can now choose which of about 90 possible employee details to capture, and that choice automatically updates the Add Employee form, self-onboarding page and bulk-upload template together.
- Fixed the field register so custom fields with no dedicated database column (like "mother's name") can still be safely recorded rather than blocked outright, and fixed a bug where a chosen field type (date, list, etc.) wasn't actually being saved.
- Built a live-preview ID Card format designer letting a company choose which fields print on the card, its size, colours and layout.
- Every configuration screen's company/branch/department dropdowns now default automatically to a company's real, live organisation data.
- Every configuration list screen gained proper Edit and Delete (retire, not permanently erase) buttons.
- Fixed the Branches screen failing to save on older customer databases, restored missing map-location fields, and linked Departments to real Company/Branch data.
- Brought the Designations screen up to the old product's fields, and every configuration screen now shows a record count and description at the top.
- Companies screen gained a colour picker and logo upload for branding documents and ID cards.
- Configuration screens now handle a missing database column gracefully instead of showing a scary warning, and removed duplicate on-screen messages.
- Fixed the Branches screen so refreshing the page after saving couldn't accidentally create a duplicate entry, and fixed the company dropdown not showing the correct saved selection.
- Added "select all" checkboxes to the Employee Field register for faster setup.
- Fixed a bug where a branch or department that was removed on one screen would still incorrectly show up as a choosable option elsewhere in the app.
- Fixed configuration screens so a page refresh after saving can't create duplicate entries, and forms now only appear when actually adding or editing something.
- Prevented duplicate codes when setting up company records, restricted "Manager/Team Leader" pickers to only employees whose actual job title matches, and linked Cost Code to real branch data.
- Standardised validation rules (phone numbers, PAN, bank account, etc.) so the Add Employee form, self-onboarding and bulk upload all reject bad data the same way with the same clear message.
- Systematically compared every old-product setup screen field-by-field and added anything missing (branch manager, overtime multiplier, late-policy details, letter templates, and more) so the new configuration screens are no longer missing fields the old product had.
- Cleanly separated "how the whole app looks for everyone" (app branding) from "how one company's own documents/payslips look" (per-company branding), which had been incorrectly mixed together; also caught and restored earlier styling fixes that had been accidentally undone.
- Fixed a crash when saving company setup records with blank optional fields, and fixed Role dropdowns (on Payslip Format and Pay Cycle) to pull from the company's real configured job roles instead of guessing someone's access level from their job title text.

11 HR Letters

1 item

- Fixed a real compliance risk: the appointment letter promised new joiners that provident fund (PF) would be deducted "in accordance with the law," while the actual payroll setup computed no PF at all and nobody was told — the system now warns whenever a letter's promises don't match what's actually configured.

12 Platform, Performance & Security

14 items

DATABASE / SETUP TOOLING

- Fixed a database login issue that was silently causing the whole system to fall back to running on plain files, with no clear explanation shown to the person setting it up.
- Fixed the installation setup script so it can reliably create the two required database accounts on a brand-new machine, instead of leaving the installer to invent usernames and passwords by hand.
- Fixed a settings-file reading bug that made setup tools silently misread perfectly correct configuration, sending the person setting up the system to fix things that weren't actually broken.
- Fixed the setup script reporting "already configured" while the underlying database login was actually broken, so a real problem was being hidden behind a false "all good" message.

PERFORMANCE

- Fixed a serious performance risk: lists, reports and dashboard tiles were loading entire database tables into memory rather than just the page being viewed, which would have caused the system to crash outright once a year of attendance data built up for a couple hundred staff.
- Fixed slow search and total-calculation performance across several screens (search dropped from about a quarter-second to near-instant at scale) while making sure long staff lists still let you correctly pick or save anyone beyond the visible cap.
- Rebuilt the internal demo/test data generator to match the owner's real company structure, and fixed a real attendance performance issue, cutting a report's load time from 13 seconds to under half a second.

SECURITY & QUALITY CHECKS

- Ran an automatic check that actually tries to save data on every screen in the product and found 5 screens that looked fine but silently failed to save; all are now fixed.
- Found and fixed a bug in the team's own testing tool that was leaving hundreds of leftover test rows behind in real database tables every time it ran, which had been quietly making some screens appear to work when they actually didn't.
- Built the product's first proper external connection point (API) so outside systems, like biometric-device software, can securely push attendance data in, with careful safeguards so no one can guess or probe for other companies' information.
- Ran a deeper set of automatic code-quality checks across the parts of the system that handle real user requests (previously only internal code was checked) and fixed 127 logic checks that looked like safety checks but were silently checking nothing.
- Delivered a large, coordinated batch of previously-missing sections (Leave, Compensation, Statutory, Performance, Learning, HR Letters, Communication, Field Force, Reports, Administration) so nearly every screen from the old product now has a working match here.
- Fixed a caching bug where the browser kept showing an outdated version of the site's look after every visual fix, making earlier fixes appear not to have worked; also reviewed the Statutory & Compliance area and confirmed the missing PF/ESI/PT/TDS figures are a business decision waiting on real tax rates, not a software gap.
- Re-checked every previously flagged open issue directly against the live system rather than trusting outdated notes, and found almost everything already worked correctly — only the documentation was out of date.

End of summary — SmartPRS 3 build programme, 8–11 September 2026.
